Chapter 1: Introduction: The New Era of No-Code AI

The business landscape is changing rapidly. Artificial intelligence is no longer a technology reserved for large corporations with dedicated engineering teams. It has become accessible to anyone with a computer and a vision.

However, for many business owners, the barrier to entry remains high. The idea of building custom AI solutions seems to require programming skills, technical expertise, and significant time investment. This perception is changing.

The Shift to Visual Development

A new generation of tools is emerging that allows anyone to build sophisticated AI agents using visual interfaces. Instead of writing code, users drag and drop components onto a canvas, connect them together, and create powerful automation workflows.

This approach democratizes AI development. It puts the power to create intelligent systems into the hands of business professionals who understand their domain but don't necessarily understand programming.

Why This Matters for Your Business

Consider the possibilities:

- A small business owner creates an agent that automatically responds to customer inquiries.
- A freelancer builds a lead generation system that works around the clock.
- A consultant designs a research assistant that summarizes industry reports.
- An agency develops custom automation solutions for their clients.

All of this is possible without writing a single line of code.

The Advantages of Localized AI Solutions

When building custom agents, there is an important choice to make: whether to use cloud-based services or localized solutions. Both have their merits, but local AI offers several compelling advantages.

Complete Data Sovereignty

With localized AI, your business data never leaves your environment. The agents you build process information on hardware you control. This gives you complete ownership of your data and eliminates concerns about third-party access.

Predictable Long-Term Costs

Cloud-based AI services typically require ongoing subscriptions. Local solutions are a one-time investment that pays for itself over time. Once you have the infrastructure set up, the marginal cost of running additional agents is minimal.

Full Customization

Local solutions can be tailored to your specific needs. You choose which models to use, how they are configured, and what data they access. This level of control is impossible with one-size-fits-all cloud services.

Uninterrupted Availability

Your agents run on your own hardware. They are available whenever you need them, regardless of what's happening with external service providers.

Chapter 2: What is SmythOS?

SmythOS is a no-code platform for building AI agents. It provides a visual canvas where users can design complex workflows by connecting different components together.

The Visual Canvas

The heart of SmythOS is its visual builder. Instead of writing code, you work with a canvas where you can:

- Drag and drop components onto the workspace
- Connect components to create workflows
- Configure each component with simple settings
- Preview and test your agent in real-time

This approach makes it possible to build sophisticated agents without any programming knowledge.

Core Components

SmythOS provides a wide range of components that you can use to build your agents:

Component Type	What It Does	Examples
LLMs	Provides intelligence and text generation	OpenAI, Claude, Llama, Qwen
Data Sources	Supplies information to your agent	Databases, APIs, files
Tools	Performs specific actions	Web search, email sending, calculations
Logic	Controls flow and decision-making	If/then rules, conditionals, loops
Integrations	Connects to external services	Slack, Google Sheets, CRM systems

Deployment Options

SmythOS agents can be deployed in multiple ways:

- **REST API:** Your agent becomes a web service that other applications can call.
- **MCP Server:** Your agent can be used by other AI systems.
- **ChatGPT:** Your agent can be integrated into ChatGPT conversations.
- **Website Chat:** Add your agent as a chat widget on your website.
- **Self-Hosted:** Run your agents on your own infrastructure.

This flexibility means you can use your agents wherever you need them.

Who Uses SmythOS?

SmythOS is designed for:

- **Small Business Owners:** Create automation for customer service, lead generation, and content creation.
 - **Freelancers:** Build agents for clients and charge for your services.
 - **Consultants:** Design custom solutions for specific business challenges.
 - **Agencies:** Scale client work by creating reusable agent templates.
-

Chapter 3: Understanding AI Agents

Before we start building, it’s important to understand what an AI agent is and how it differs from a simple chatbot.

Agents vs. Chatbots

Feature	Simple Chatbot	AI Agent
Purpose	Responds to user messages	Completes complex tasks
Memory	Limited to conversation history	Accesses knowledge bases and data sources
Actions	Only text responses	Can trigger actions, make decisions
Workflow	Linear conversation	Multi-step processes with branching logic
Integrations	None or minimal	Can connect to APIs, databases, and tools

The Power of Multi-Step Workflows

A simple chatbot responds to a question with an answer. An AI agent can do much more:

1. Receive a request from a user.

2. Analyze the request to understand what's needed.
3. Retrieve relevant information from a knowledge base.
4. Make a decision about how to proceed.
5. Execute one or more actions.
6. Generate a response to the user.

This multi-step capability is what makes agents so powerful for business automation.

Example: Customer Support Agent

Let's consider what a customer support agent might do:

1. **User asks:** "What is my order status?"
2. **Agent retrieves:** The user's order information from a database.
3. **Agent checks:** Whether the order has shipped.
4. **Agent decides:** If shipped, provide tracking information. If not, provide estimated delivery date.
5. **Agent responds:** With the appropriate information.

This entire process happens automatically, without human intervention.

Types of Agents

There are several types of agents you can build:

Task-Oriented Agents

These agents are designed to complete specific tasks, such as: - Sending email outreach - Scraping leads from websites - Generating content - Processing invoices

Knowledge-Based Agents

These agents specialize in accessing and using information: - Research assistants - Document summarization - FAQ responders

Hybrid Agents

The most powerful agents combine multiple capabilities: - Customer support with knowledge base access - Lead generation with data enrichment - Content creation with research capabilities

Chapter 4: Setting Up Your Agent Studio

Now that you understand what SmythOS is and what agents can do, it's time to set up your development environment.

Prerequisites

Before you begin, ensure you have:

- A computer with at least 8 GB RAM (16 GB recommended)
- A modern web browser
- Basic computer literacy

Option 1: Cloud Setup (Simplest)

The easiest way to start is by using SmythOS's cloud platform.

1. Go to the SmythOS website.
2. Create a free account.
3. Log in to your dashboard.
4. You're ready to start building.

Advantages: - No installation needed - Accessible from any device - Automatic updates - Free tier available

Considerations: - Requires internet connection - Some features may require paid plan

Option 2: Local Setup (Recommended for Privacy)

For maximum control and privacy, you can run SmythOS on your own hardware.

For Windows Users:

1. Install Docker Desktop from docker.com.
2. Open Docker Desktop and ensure it's running.
3. Open a terminal (PowerShell).
4. Run the setup command:

```
docker run -d -p 7331:7331 smythos/smythos
```

5. Open your browser and go to <http://localhost:7331>.

For macOS Users:

1. Install Docker Desktop from docker.com.
2. Open Docker Desktop and ensure it's running.
3. Open Terminal.
4. Run the setup command:

```
docker run -d -p 7331:7331 smythos/smythos
```

5. Open your browser and go to <http://localhost:7331>.

For Linux Users (Ubuntu/Debian):

1. Install Docker:

```
sudo apt update
sudo apt install docker.io -y
sudo systemctl enable docker
sudo systemctl start docker
```

2. Run the setup command:

```
docker run -d -p 7331:7331 smythos/smythos
```

3. Open your browser and go to <http://localhost:7331>.

Option 3: Local Development (Advanced)

For users who want more control:

1. Install Node.js (version 20+).
2. Install Python (version 3.10+).
3. Clone the repository:

```
git clone https://github.com/smythos/smythos.git
cd smythos
```

4. Install dependencies:

```
npm install
```

5. Start the development server:

```
npm run dev
```

6. Open your browser and go to `http://localhost:3000`.

Verifying Your Setup

Whether you chose cloud or local, you should see the SmythOS interface. Look for:

- A visual canvas area
 - A sidebar with components
 - A toolbar for configuring
 - A preview panel for testing
-

Chapter 5: Your First Agent: A Simple Chatbot

Let's start by building a simple chatbot that can answer basic questions. This will teach you the fundamentals of using SmythOS.

The Goal

We'll build an agent that:

- Accepts user questions
- Uses an AI model to generate responses
- Returns answers in a chat interface

Step 1: Create a New Agent

1. Click "Create New Agent" or "+" button.
2. Give your agent a name (e.g., "Support Assistant").
3. Choose a blank canvas or a template.

Step 2: Add an LLM Component

1. From the sidebar, find the "LLM" section.
2. Drag an LLM component onto the canvas.
3. Configure the LLM:
 - **Provider:** Choose your preferred AI provider (e.g., OpenAI, Anthropic, or local Ollama).
 - **Model:** Select the model you want to use (e.g., GPT-4, Claude, or Llama 3.1).
 - **Temperature:** Set creativity level (e.g., 0.7 for balanced responses).

Step 3: Add an Input Component

1. Find the “Input” section in the sidebar.
2. Drag an input component onto the canvas.
3. Configure the input:
 - **Type:** Text input.
 - **Label:** “User Question”.
 - **Placeholder:** “Ask me anything about your business.”

Step 4: Add a Response Component

1. Find the “Response” or “Output” section.
2. Drag a response component onto the canvas.
3. Configure the response:
 - **Format:** Text response.
 - **Display:** Show in chat.

Step 5: Connect Everything

1. Draw a line from the Input component to the LLM component.
2. Draw a line from the LLM component to the Response component.

Your canvas should now look like:

[Input] → [LLM] → [Response]

Step 6: Configure the System Prompt

Click on the LLM component and add a system prompt:

You are a helpful assistant that answers questions about the user's business. Provide clear, accurate, and professional responses. If you don't know the answer, say so honestly and suggest ways to find more information.

Step 7: Test Your Agent

1. Click “Preview” or “Test” button.
2. Type a question in the input field.
3. Press Enter or click Send.
4. Your agent should respond with an answer.

What You've Built

You now have a working chatbot that: - Takes user input - Uses an AI model to generate responses - Returns answers in a chat interface

This is the foundation for more complex agents.

Chapter 6: Adding Intelligence: Connecting LLMs and APIs

A simple chatbot is useful, but the real power of agents comes from connecting them to external services and data sources.

Working with Multiple LLMs

SmythOS allows you to use different LLMs for different tasks. This is powerful because:

- Some models are better at specific tasks.
- You can optimize for speed vs. quality.
- You can use local models for privacy-sensitive tasks.

Example Configuration:

Task	Recommended Model
General Q&A	GPT-4 or Claude
Fast Responses	Llama 3.1 8B
Technical Analysis	Qwen 2.5 14B
Content Creation	GPT-4 or Claude

Connecting to APIs

APIs are how your agent communicates with external services. You can connect to:

- **Customer Relationship Management (CRM)** systems
- **Email services** (Gmail, Outlook)
- **Calendar services** (Google Calendar)
- **Payment systems** (Stripe, PayPal)
- **Social media platforms** (Twitter, LinkedIn)

- **Data sources** (databases, spreadsheets)

How to Connect an API:

1. Find the “API” section in the sidebar.
2. Drag an API component onto the canvas.
3. Configure:
 - **API Endpoint:** The URL of the service.
 - **Authentication:** API key or OAuth credentials.
 - **Method:** GET, POST, PUT, DELETE.
 - **Parameters:** Any required data.

Example: Lead Scraper Agent

Let’s build an agent that scrapes leads from a website:

1. **Input:** User provides a URL.
2. **Web Search Tool:** The agent uses a search tool to find relevant pages.
3. **Data Extraction:** The agent extracts contact information from the pages.
4. **Data Storage:** The agent saves leads to a database or spreadsheet.
5. **Response:** The agent confirms how many leads were found.

Example: Email Outreach Agent

Let’s build an agent that sends personalized emails:

1. **Input:** User provides a lead’s name and company.
2. **LLM:** The agent generates a personalized email.
3. **Email API:** The agent sends the email through an email service.
4. **Response:** The agent confirms the email was sent.

Using Local Models

For privacy-sensitive tasks, you can connect to local models running on your own hardware (e.g., Ollama). This keeps your data on your servers.

How to Connect Local Ollama:

1. In your LLM component, select “Custom” or “Other” provider.
2. Set the base URL to `http://localhost:11434`.
3. Set the model name (e.g., `qwen2.5:7b`).

4. Set the API key to ollama (Ollama doesn't require a real key).

Chapter 7: Grounding Your Agent with RAG

One of the most powerful features of AI agents is their ability to access and use your business knowledge. This is called Retrieval-Augmented Generation (RAG).

What is RAG?

RAG allows your agent to: - Search through your documents - Find relevant information - Use that information to answer questions

This means your agent can answer questions about your specific business, not just general knowledge.

Creating Data Pools

A data pool is a collection of documents that your agent can search. This could include:

- Product catalogs
- Customer FAQs
- Business policies
- Industry reports
- Meeting notes
- Marketing materials

How to Create a Data Pool:

1. Find the “Data” or “Knowledge” section in the sidebar.
2. Click “Create Data Pool.”
3. Give your data pool a name (e.g., “Product Information”).
4. Upload your documents (PDF, Word, Markdown, Text).
5. Configure how the data is indexed.
6. Save the data pool.

Connecting RAG to Your Agent

Once you have a data pool, you can connect it to your agent:

1. Find the “RAG” or “Vector Search” component.
2. Drag it onto your canvas.

3. Select your data pool.
4. Configure search parameters (e.g., number of results).
5. Connect it to your LLM component.

Example: Customer Support Agent with RAG

Let's build a support agent that uses your knowledge base:

1. **Input:** User asks "What is your return policy?"
2. **RAG Component:** Searches your policy documents.
3. **Retrieved Information:** Finds the relevant policy sections.
4. **LLM:** Uses that information to craft a response.
5. **Response:** Provides the exact policy details.

Example: Research Assistant with RAG

Let's build an agent that summarizes industry reports:

1. **Input:** User asks "What are the key trends in our industry this year?"
2. **RAG Component:** Searches your industry reports.
3. **Retrieved Information:** Finds relevant sections.
4. **LLM:** Synthesizes the information into a summary.
5. **Response:** Provides a comprehensive overview.

Benefits of RAG

- **Accurate Answers:** Your agent uses your specific information.
 - **Reduced Hallucination:** The agent is grounded in real data.
 - **Up-to-Date Information:** You can update data pools as needed.
 - **Domain Expertise:** Your agent understands your business.
-

Chapter 8: Real-World Use Cases

Now that you understand the basics, let's explore some practical applications for your business.

Email Outreach Assistant

Purpose: Automatically send personalized emails to potential clients.

Workflow:

1. **Input:** User provides a list of leads.
2. **LLM:** Generates personalized email content for each lead.
3. **Email API:** Sends the emails through an email service.
4. **Tracking:** Monitors responses and follow-ups.
5. **Response:** Confirms emails sent and tracks engagement.

Benefits: - Saves hours of manual outreach - Consistent messaging - Follow-up automation - Improved response rates

Lead Scraper

Purpose: Automatically find and collect potential leads from websites.

Workflow:

1. **Input:** User provides a URL or search criteria.
2. **Web Search Tool:** Finds relevant pages.
3. **Data Extraction:** Extracts contact information.
4. **Data Storage:** Saves leads to a database.
5. **Response:** Confirms leads found and stored.

Benefits: - Automated lead collection - Saves manual research time - Consistent data capture - Scalable to large volumes

Content Creation Agent

Purpose: Generate high-quality content for marketing and communication.

Workflow:

1. **Input:** User provides topic, audience, and tone.
2. **LLM:** Generates content (blog posts, social media, emails).
3. **RAG:** Incorporates your existing content and brand voice.
4. **Output:** Delivers finished content.
5. **Review:** User reviews and edits as needed.

Benefits: - Faster content production - Consistent brand voice - Scalable content creation - Reduced costs

Customer Support Chatbot

Purpose: Provide instant responses to customer inquiries.

Workflow:

1. **Input:** Customer asks a question.
2. **RAG:** Searches knowledge base for answers.
3. **LLM:** Generates a helpful response.
4. **Response:** Delivers the answer.
5. **Escalation:** Routes complex issues to human agents.

Benefits: - 24/7 availability - Consistent answers - Reduced support workload - Improved customer satisfaction

Workflow Automation (e.g., Invoice Processing)

Purpose: Automate repetitive business processes.

Workflow:

1. **Input:** User uploads an invoice.
2. **Data Extraction:** Extracts key information (amount, date, vendor).
3. **Validation:** Checks for errors or missing data.
4. **Processing:** Updates records or triggers actions.
5. **Response:** Confirms processing and provides details.

Benefits: - Reduced manual data entry - Fewer errors - Faster processing - Consistent workflows

Research Summarizer

Purpose: Automatically summarize long documents.

Workflow:

1. **Input:** User uploads a document.
2. **RAG:** Searches and extracts key points.
3. **LLM:** Generates a comprehensive summary.
4. **Output:** Delivers the summary.
5. **Review:** User reviews and refines as needed.

Benefits: - Saves time reading long documents - Consistent formatting - Improved comprehension - Easy to share

Chapter 9: Deploying Your Agent

Once you've built your agent, you need to deploy it so others can use it.

Deployment Options

SmythOS provides multiple deployment options:

REST API

Your agent becomes a web service that other applications can call.

How to Deploy: 1. Click “Deploy” on your agent. 2. Select “REST API.” 3. Copy the API endpoint URL. 4. Use the endpoint in your applications.

Example Usage:

```
POST https://api.smythos.com/v1/agents/your-agent-id/query
{
  "message": "What is our refund policy?"
}
```

MCP Server

Your agent can be used by other AI systems, including Claude and other agents.

How to Deploy: 1. Click “Deploy” on your agent. 2. Select “MCP Server.” 3. Copy the MCP endpoint URL. 4. Configure your AI system to use it.

ChatGPT Integration

Your agent can be integrated into ChatGPT conversations.

How to Deploy: 1. Click “Deploy” on your agent. 2. Select “ChatGPT.” 3. Follow the prompts to connect. 4. Your agent becomes available in ChatGPT.

Website Chat

Add your agent as a chat widget on your website.

How to Deploy: 1. Click “Deploy” on your agent. 2. Select “Website Chat.” 3. Copy the embed code. 4. Paste the code into your website's HTML.

Self-Hosted

Run your agents on your own infrastructure.

How to Deploy: 1. Click “Deploy” on your agent. 2. Select “Self-Hosted.” 3. Download the deployment package. 4. Run the package on your server.

Chapter 10: Making Money as an Agent Builder

Building custom agents isn’t just useful for your own business. It’s a skill that can generate income.

Freelance Opportunities

What You Can Offer:

Service	Description	Price Range
Consultation	Advise clients on how to use AI agents	\$50-\$150/hour
Agent Building	Create custom agents for clients	\$500-\$2,000 per agent
Template Creation	Build reusable agent templates	\$100-\$500 per template
Training	Teach clients to build their own agents	\$200-\$1,000 per session

Agency Services

As an agency, you can scale your offerings:

Service Packages:

Package	What’s Included	Price
Starter	1 custom agent + consultation	\$500
Professional	3 custom agents + training	\$1,500
Enterprise	Unlimited agents + ongoing support	\$5,000+

White-Labeled Spaces

If you’re an agency, you can create white-labeled spaces for your clients. This means your clients see your branding, not SmythOS’s.

How It Works: 1. Create a project space for each client. 2. Customize the branding. 3. Invite your client to collaborate. 4. Charge for the service.

Selling Templates

Create reusable agent templates and sell them.

Template Marketplace Ideas:

Template	Target Audience	Price
Customer Support Agent	Small businesses	\$50
Lead Scraper	Sales teams	\$75
Content Creator	Marketers	\$100
Invoice Processor	Freelancers	\$75
Research Summarizer	Consultants	\$50

Finding Clients

Where to Find Opportunities:

- LinkedIn networking
- Local business associations
- Online communities (Reddit, Facebook groups)
- Freelance platforms (Upwork, Fiverr)
- Industry conferences and events

Chapter 11: Security and Best Practices

Building powerful agents comes with responsibility. Here’s how to keep your systems secure.

Runtime Kernel

SmythOS provides a runtime kernel that adds security controls to your agents.

Key Features: - Isolates agent processes - Limits resource usage - Monitors for unusual behavior - Prevents unauthorized access

Kill Switches

Every agent should have a kill switch that can immediately stop it if needed.

When to Use a Kill Switch:

- If an agent is misbehaving
- If an agent is making unexpected decisions
- If you need to pause operations
- If there's a security concern

Avoiding Prompt Injection

Prompt injection is a security risk where malicious input tricks the AI into taking unintended actions.

How to Prevent It:

1. **Sanitize Input:** Remove potentially dangerous content.
2. **Limit Actions:** Restrict what the agent can do.
3. **Use System Prompts:** Emphasize boundaries and security.
4. **Monitor Activity:** Watch for unusual behavior.

Data Privacy

Best Practices:

1. **Encryption:** Encrypt sensitive data at rest and in transit.
2. **Access Control:** Limit who can access your agents.
3. **Audit Logs:** Keep records of agent activity.
4. **Regular Updates:** Keep your systems up to date.

Compliance Considerations

Depending on your industry, you may need to comply with:

- **GDPR:** For European customers
 - **CCPA:** For California residents
 - **HIPAA:** For health information
 - **PCI DSS:** For payment data
-

Chapter 12: Scaling and Collaboration

As your use of AI agents grows, you'll need to scale your operations and collaborate with others.

Working with Teams

Collaboration Features:

- Shared workspaces
- Version control
- Comment threads
- Role-based permissions
- Activity tracking

Project Spaces

Create dedicated spaces for different projects or clients:

Example Structure:

```
Projects/  
├── Client A/  
│   ├── Customer Support Agent  
│   └── Lead Scraper  
├── Client B/  
│   ├── Content Creator  
│   └── Invoice Processor  
└── Internal/  
    ├── Research Assistant  
    └── Social Media Manager
```

Version Control

Track changes to your agents over time:

- Every change is saved.
- You can roll back to previous versions.
- You can compare different versions.
- You can test changes before deploying.

Scaling Agents

When to Scale:

- When you need more agents than you can manage
- When you need to handle more requests
- When you need to serve multiple clients
- When your agents need more resources

How to Scale:

1. **Use Templates:** Create reusable agent templates.
 2. **Automate Deployment:** Use CI/CD pipelines.
 3. **Monitor Performance:** Track metrics and optimize.
 4. **Use Cloud Resources:** Scale up when needed.
-

Chapter 13: Troubleshooting and Optimization

Even the best-built agents sometimes encounter issues. Here's how to troubleshoot and optimize.

Common Problems

Agent Not Responding

Solutions: - Check if your LLM API key is valid. - Verify your internet connection. - Check if the model is available. - Review your agent's logs.

Incorrect Responses

Solutions: - Improve your system prompt. - Add more context to your RAG data pool. - Adjust the model temperature. - Test with different inputs.

Slow Performance

Solutions: - Use a faster model. - Reduce the context size. - Optimize your workflow. - Limit concurrent requests.

Integration Failures

Solutions: - Check API credentials. - Verify endpoint URLs. - Test the API independently. - Review error messages.

Debugging Workflows

Step 1: Review Your Workflow

Look at the visual canvas. Check that all components are properly connected.

Step 2: Inspect Component Settings

Each component has configuration settings. Review them for correctness.

Step 3: Add Logging

SmythOS provides logging tools. Use them to track what's happening in your workflow.

Step 4: Test Incrementally

Test each component separately before testing the full workflow.

Performance Optimization

Techniques to Improve Performance:

Technique	Description
Caching	Store frequently used data
Parallel Processing	Run multiple tasks simultaneously
Model Selection	Use faster models when possible

Technique	Description
Workflow Simplification	Remove unnecessary steps
Resource Tuning	Allocate more resources when needed

Chapter 14: The Future of AI Agents

The landscape of AI agents is evolving rapidly. Understanding where this technology is heading helps you stay ahead.

Emerging Trends

1. More Accessible No-Code Tools

The barrier to entry for building AI agents continues to lower. Expect more tools that make it even easier for non-technical users to create sophisticated agents.

2. Improved Model Capabilities

As models become more capable, agents will be able to handle more complex tasks with better accuracy.

3. Enhanced RAG Integration

Retrieval-Augmented Generation will become more sophisticated, allowing agents to access and use even larger knowledge bases.

4. Better Orchestration

Expect more powerful tools for coordinating multiple agents working together on complex tasks.

5. Increased Local AI Adoption

As privacy concerns grow, more businesses will adopt localized AI solutions that run on their own hardware.

The Growing Importance of AI Agents

For businesses of all sizes, AI agents represent a significant opportunity:

- **Automation:** Reduce manual work and improve efficiency.
- **Scalability:** Handle more work without hiring more staff.

- **Customer Experience:** Provide better, faster service.
- **Competitive Advantage:** Stay ahead of competitors who haven't adopted AI.

Your Role in This Future

By learning to build custom AI agents, you're positioning yourself at the forefront of a major technological shift. Whether you're automating your own business or building agents for clients, this skill will be increasingly valuable.

Conclusion

You now have a comprehensive understanding of how to build custom AI agents without code. You've learned:

- How SmythOS works and its core components
- How to create your first agent
- How to connect LLMs and APIs
- How to ground agents with RAG
- Real-world use cases
- Deployment options
- How to make money as an agent builder
- Security best practices
- Scaling and collaboration
- Troubleshooting and optimization
- The future of AI agents

Your Next Steps

1. **Set up SmythOS** using the instructions in Chapter 4.
2. **Build your first agent** following Chapter 5.
3. **Add RAG** to your agent to make it smarter.
4. **Explore use cases** that apply to your business.
5. **Deploy** your agent and start using it.
6. **Consider offering** agent-building services to others.

The power to create intelligent automation is now in your hands. Start small, experiment, and grow your capabilities over time. The possibilities are endless.

About Mercel

Mercel is dedicated to helping businesses leverage AI technology for sustainable growth. We build custom AI systems that run on your own hardware, ensuring your data never leaves your servers. We also provide comprehensive guides and consulting services for those who want to harness the power of AI in their business operations.

Visit us at mercel-vercel.vercel.app to learn more.

This guide was created using a local AI assistant running on a personal server.
